Pneumonia biliosa

This disease comes on, with languor, and debility, which are soon succeeded, by chills, flying pains all over the body; bilious vomiting, and purging, and sometimes diarrhoea and colic; which are followed in a short time by quick breathing, considerable thirst, head ache, and other febrile symptoms. In a few hours the respiration, becomes more difficult and laborious; the patient being seized with pain in the side, extending towards the clavicle, and shoulder, and downwards along the cartilages of the false ribs; sometimes darting from the Sternum, towards the dorsal vertebrae; attended at this time, with great difficulty, in making a full inspiration, and with considerable pain in coughing.

[Faint, illegible handwritten text, likely bleed-through from the reverse side of the page.]

These are the symptoms which for the most part appear, but the patient will sometimes complain of heaviness, and oppression in the breast, probably depending upon that state of the lungs, which the French express by the word engorgement, and which we meet with in *peripneumonia notha*: Sometimes palpitation of the heart, preternatural heat, or cold, are accompanying symptoms.

Cleghorne in treating of this disease, as it appeared in *Minorea*, observes that it was not uncommon for the pains to move about in the thorax from one side, to the other, Sometimes they would shift from from the breast, to the limbs, and suddenly return to the bowels; in some rare instances, after leaving one side, they unexpectedly attacked the other, and thus proved fatal in a short time. The left side of the thorax was not so liable to be affected as the other; probably the effect, Says *Le Ruc* of

the combination of bilious fever, which disposed to hepatic pains, and obstructions.

Whichever side was affected, the sick lay easiest on the opposite: though the generality were obliged to lie upon their backs, or to sit up in bed, with their heads erect. The external heat was in some cases less than natural, but for the most part it was very severe; the pulse was variable not only in different persons; but in the same person, at different times. There was a difference in respect to strength in different arms, that of the pained side being most obscure, a natural pulse indicated great danger. Nor was the colour or consistence of the blood to be trusted, in many it had a white, or pale yellow colour, the serum being of the same complexion, but for the most part, it was red or florid. It frequently changed its appearance in a few hours. Dr Rush observes that from the state of skin, the pulse, and

The first thing I noticed when I stepped
out of the car was a warm blanket of
sun on my face. The air was thick with
the scent of blooming flowers, a mix of
jasmine and something I couldn't quite
identify. I took a deep breath, feeling
the humidity settle into my lungs. The
city around me was a blur of colors and
sounds, a symphony of life. I walked
towards the center, my feet finding their
way through the crowded streets. The
people here were a mix of old and new,
their faces telling stories of a city that
had seen it all. I felt a sense of
belonging, a feeling that I had finally
found my place in the world. The sun
was high in the sky, and the shadows
were long. It was a perfect day, a day
that I would never forget.

the blood, that this disease partook a good deal of a malignant nature. The changes in the appearances of the blood, drawn at different times, show how much they are influenced by the various states, and force of the blood vessels.

The patient being able to sleep sound in a natural posture, and to make a full inspiration with ease until his thirst, and inward heat are moderate, are favorable symptoms. In this, as in most febrile diseases, there is some remission in the morning; and about the third, or fourth day, Dr. Cullen observed a considerable remission, and even sometimes a total cessation of every violent symptom; but this was remarked by him, to be a treacherous remission; for on the fourth or fifth, a delirium suddenly came on, or the breathing became more difficult than ever, and one, or both of those symptoms increasing hourly, the patient expired in a day or two either

suffocated or raving mad.

When sufficient evacuations have not been made in the early stage of the complaint; nature sometimes relieves herself by some excretion, as a copious sweat, a considerable expectoration, or a discharge of bile, and thus the life of the patient, may be saved.

Dissections exhibit every appearance which we meet with in violent inflammation of the lungs, and in bilious fevers; as abscesses in the substance of the lungs, and liver; adhesions, suppuration, gangrene, and a membrane, the effect of inflammation.

In the pneumonia biliosa or bilious pleurisy of authors; the system labours under two distinct, and violent morbid actions; the one in the liver and stomach, the other in the lungs.

This disease appears after the season of the year, when the bilious or the yellow fever prevails, it is in attacks those, who have been debilitated by either

of the above mentioned fevers, since it occurs after
autumnal epidemics. Those persons who have escap-
ed the bilious fever in the fall, if they have been expo-
sed to its remote causes, are generally affected with
the pneumonic biliosa in the winter and spring.

It is influenced in its violence by the change
of the atmosphere, and Dr Sedenham when tre-
ating of it, observes, "that whoever in the cure of
diseases has not always in view the constitution of
the atmosphere, in as much as it tends to produce
some particular epidemic, and likewise to render
all the ordinary diseases, to its form, and likeness,
proceeds in an uncertain and fallacious manner."

This remark of his will apply very well to the
Complaint; and from what has been said of its depen-
dence upon the same remote cause producing
the bilious, and yellow fevers, it must be evi-
dent that any of the exciting causes of fever,

as very sudden changes in the weather, cold applica-
to the body, when heated, violent exercise, too long
and loud speaking, &c may throw the system into
unhealthy and irregular action, and thus produce
the disease.

As we meet with the Synochus fortis, Synochus,
typhica, and the typhic pulse, our remedies must
be various or suited to the varying and opposite
states of the system.

Where the pulse is Synochic or Synochus fortis all
indicate with symptoms indicating great morbid ex-
citement. Bloodletting should be carried to a
very great extent it should be repeated as often
as occasion may require, and if possible, the blood
should be drawn off early in the disease.

Dr Cleghorn after becoming well acquainted
with it dangerous tendency, and the formidable
and even fatal symptoms, which in almost every

Card occurred, and that too in a very short time,
unless sufficient evacuations were made, was in
the habit of taking from thirty to forty ounces of
blood from the patient, in the first twenty-four
hours of his attendance, provided he was called
in time. Little very great dependance in such
a state of the system, is to be placed on the lancet;
Still our practice would be uncertain were we to
rely solely on it.

Purges from the great Secretion, and excretion
of bile, are of essential service: these should be the
chief means, in the case of Acute or Milder or
aims to an Acute, or then should be Calomel,
combined with Jalap, rhubarb, or the may apple
of our Country. It is sometimes necessary to give
them every day, or even, other day, and here as
in other violent diseases they will operate more
effectually after Bloodletting.

Blisters may likewise be applied, they should as
Dr. Cullen observes in all pulmonary affections be lar-
ge, it will be improper to use them until sufficient
evacuations have been made unless indeed, in some
cases, when they may be applied in the very
first stage.

Emollients have been highly recommended and they
certainly are entitled to our attention; but should
never be used, where there is great morbid action
and this must be reduced to the above exciting
remedies previous to their employment. No support
of what has been said of the efficacy of emollients,
have been informed by Dr. Henry Jackson
of Saranack, that the negroes, who work in the
low marshy grounds near that town, and who
are often affected with the bilious pleurisy in the
winter and spring, never require more than
one small blinding, after promoting this, are

emetic of the tartar emeticum, appears to act like
a charm, removing all the troublesome symptoms
and curing the patient in a very short time.

A circumstance worthy of notice is, that they are
seldom affected with the fevers which prevail in
the autumn, and which prove so fatal to the
infants, but immediately upon the approach of
cold weather, and during its continuance, they are
subject to the *incumonia villosa*, and are cured
as above mentioned.

In that form of the disease in which the pa-
tient is affected with lameness, considerable debility,
and a disposition to faint upon rising from bed,
and in which the pulse is typhoid, and
tuphus, our remedies must be the reverse of
what is found ~~so~~ essentially necessary in the
opposite state of the system above mentioned. Insti-
tute of the Lancet, the various Stimulants as

The Volat: alk: gum. the Virginia Snake root
and Camphor must be used.

Before giving any one, or all of these it will be
proper to administer an Emetic; From what I
have seen of the good effects of Camphor alone,
and when combined with Calomel, in tinea
fever attended with debility, I have no doubt
but that it will be found a valuable remedy
and this opinion of its probable efficacy is
strengthened from having used it most in
certain stages of pneumonia vera with advan-
tage. Blesters may be applied if the pain
is considerable.

In every stage of the complaint, if the cough,
and difficulty in expectorating, should prove trou-
sive, demulcents must be given - and phials
may likewise be employed for the same
purpose - I used at the previous bark

once Columbo, hard been given, and where the
debility is great, or where with this, the disease
presents in the form of an intermittent fever. Certainly
may be used with advantage to the patient,
